Corso di Dottorato in
Scienze della Terra
(PhD, Earth Sciences)

Milano - 12-14 Febbraio 2019 - Short course (15 ORE)

Ocean crust accretion processes at mid-ocean ridges

Dr. Benoit Ildefonse

After an overview of basic knowledge of mid-ocean ridges (e.g., morphology, segmentation, bathymetry, magmatism and hydrothermalism), this course will outline the principal characteristics of slow- and fast-spreading ridges, and discuss the crustal accretion processes (e.g. emplacement of magmatic crust, hydrothermal cooling, role of detachment faulting).

It will be based on published examples of geological and geophysical studies of ocean crust and mid-ocean ridges, and aims to summarize our current understanding of how new ocean crust is formed. The seminars on the last day, dedicated to lessons learned from scientific ocean drilling and to submarine geology, are meant to introduce some aspects of marine geology to a more general audience.

Dr. Benoit Ildefonse

Director of Geosciences Montpellier
CNRS, University of Montpellier (France)

CICLO DI SEMINARI - Ocean crust accretion processes at mid-ocean ridges
Dr. Benoit Ildefonse

12 Febbraio 2019

ore 10.30 – 12.30: General overview on Mid-Ocean Ridges

ore 13.30 – 16.30: Crustal accretion processes at fast-spreading ridges

13 Febbraio 2019

ore 10.30 – 12.30: Crustal accretion processes at slow-spreading ridges I

ore 13.30 – 16.30: Crustal accretion processes at slow-spreading ridges II

14 Febbraio 2019

ore 10.30 – 12.30: Lessons learned from scientific ocean drilling

ore 13.30 – 16.30: Seafloor geology by submersibles
